Development Task

Hello developer,

we would like to get to know you and your way of programming. We have the following task and are already looking forward to see the result.

Please implement a small chat client as web application, using angular(>v4), material design, node.js and typescript.

Your result can look like this:

The chat client has following requirements:

- Add a user when starting the first time in a browser
- Provide a list of chat users
- Allow entering text into an edit field with a button for sending the message
- Broadcast the message to all users
- By double clicking on a chat user add the name starting with a "@" into text field (like: @<username>)
- It is sufficient if the chat client works locally in several browser tabs

Take your time, but finish after 3-4 hours. Zip the result and send it to us.

We wish you happy coding and looking forward to get the result!!

Greetings,
medondo Development Team
